Prepare a simple app that loads fake users data from URL:
https://jsonplaceholder.typicode.com/users

1. The app should follow the provided design as much as possible but do not go over 2 days limit. Implement as much as you can within that time. The most important aspect is that the app compiles, builds works on a device or simulator and allows for opening all designed screens. Animations, UI look, and feel can be added later based on amount of time remaining and skill set. If map integration is time consuming, then use some image placeholder from the web.

2. Please prepare the project as if it was part of your daily job. We will look not only on the code but on other aspects such as documentation, devOps and other aspects for additional points.
